Garden Fresh

We always source garden fresh, naturally ripened mangos ensuring no preservatives and harmful pesticides were used.

Uncompromising Quality

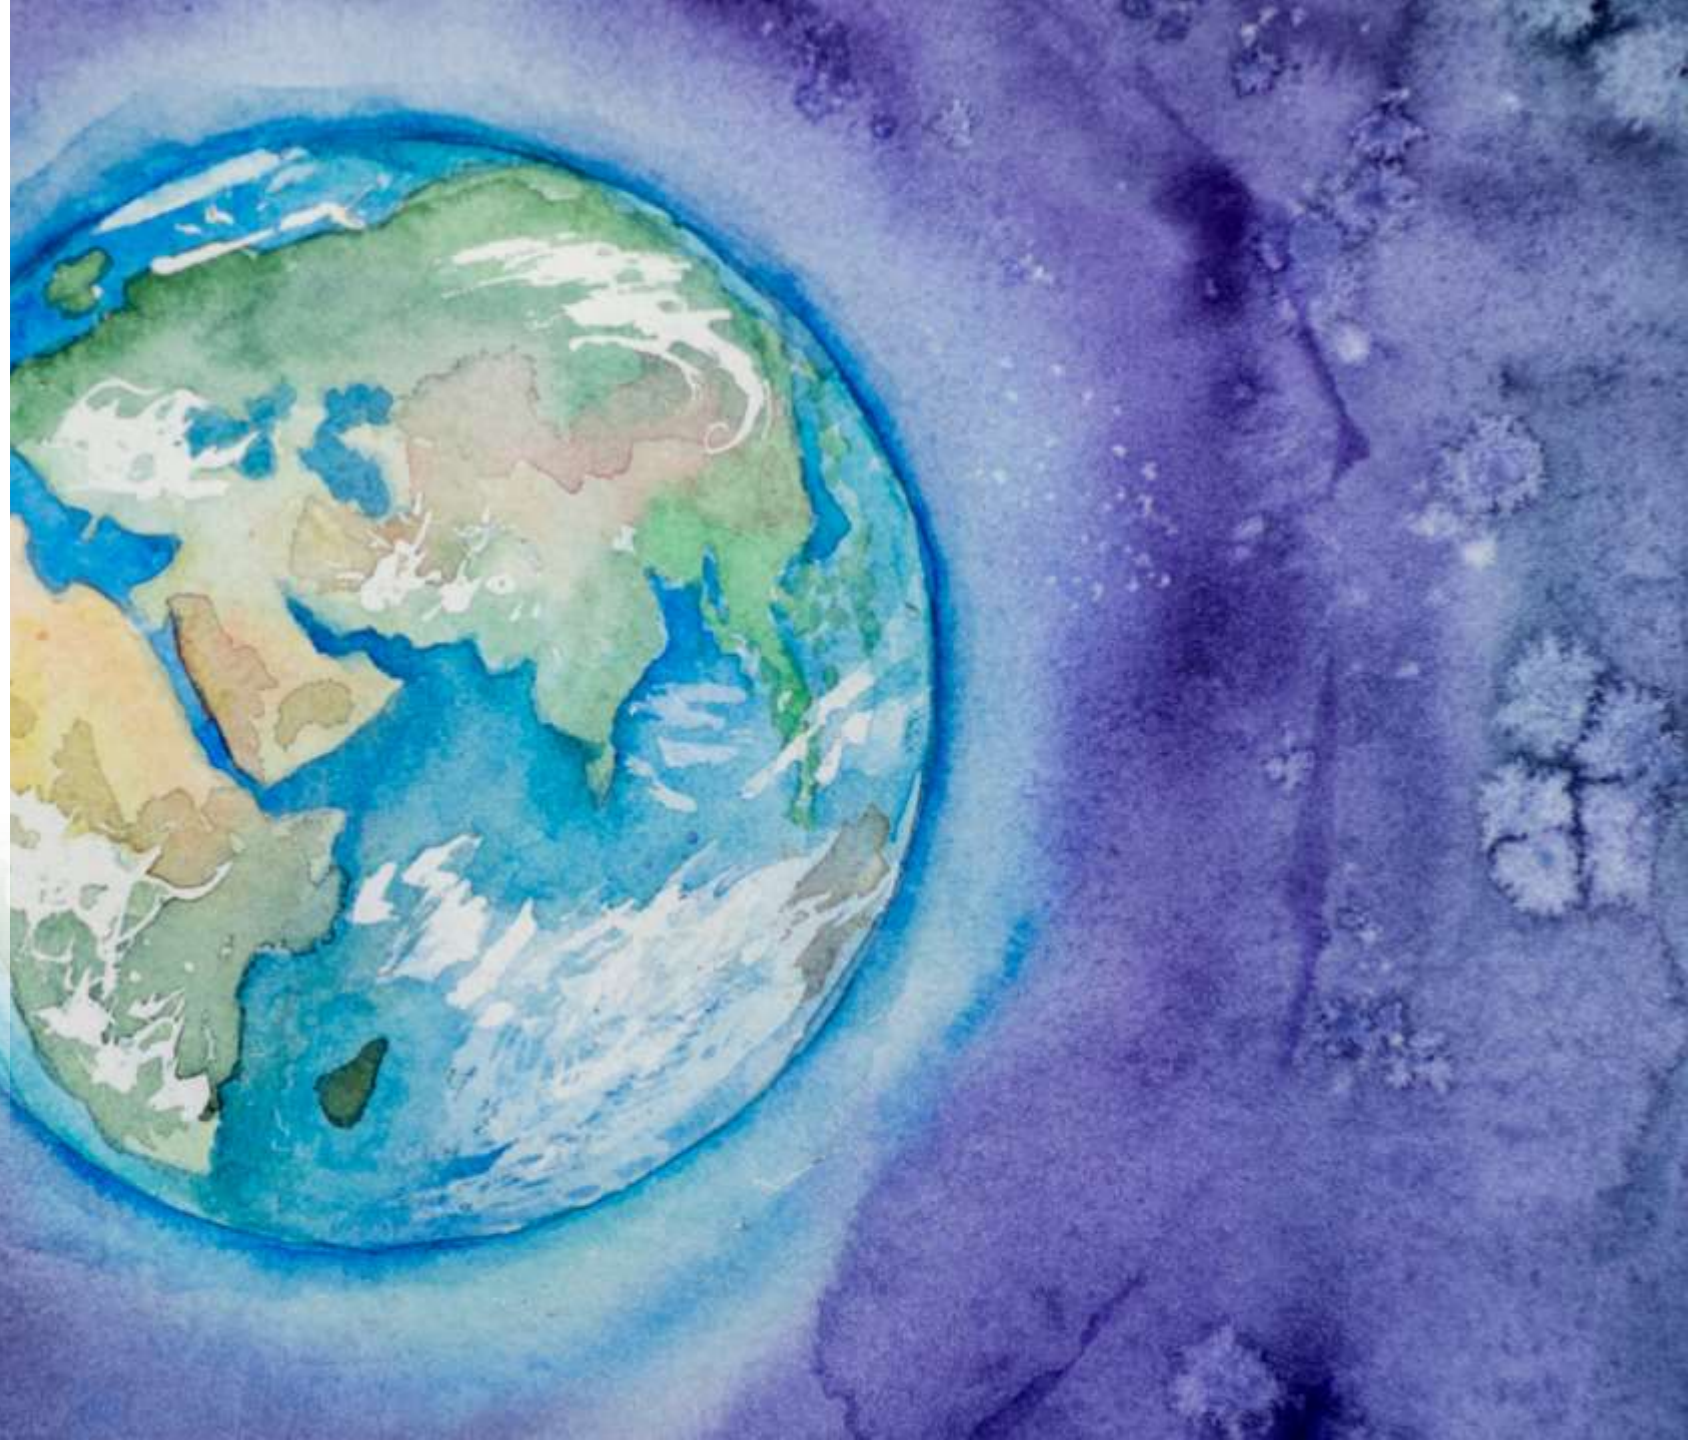

We follow a strict quality control protocol that starts with sourcing the raw materials, meticulously followed in every step till the products are processed, packed, and dispatched from our facility. Not only do we use the best raw materials, but we also pack them in premium quality aseptic bags that are imported from Europe.

Zero Discharge

All our activities are environmentally conscious. We ensure we are not harming the environment in any way. We have a zero discharge policy that enforces recycling of all our byproducts. We are also harvesting millions of liters of rainwater purified and used in production.

State of the Art Cleaning

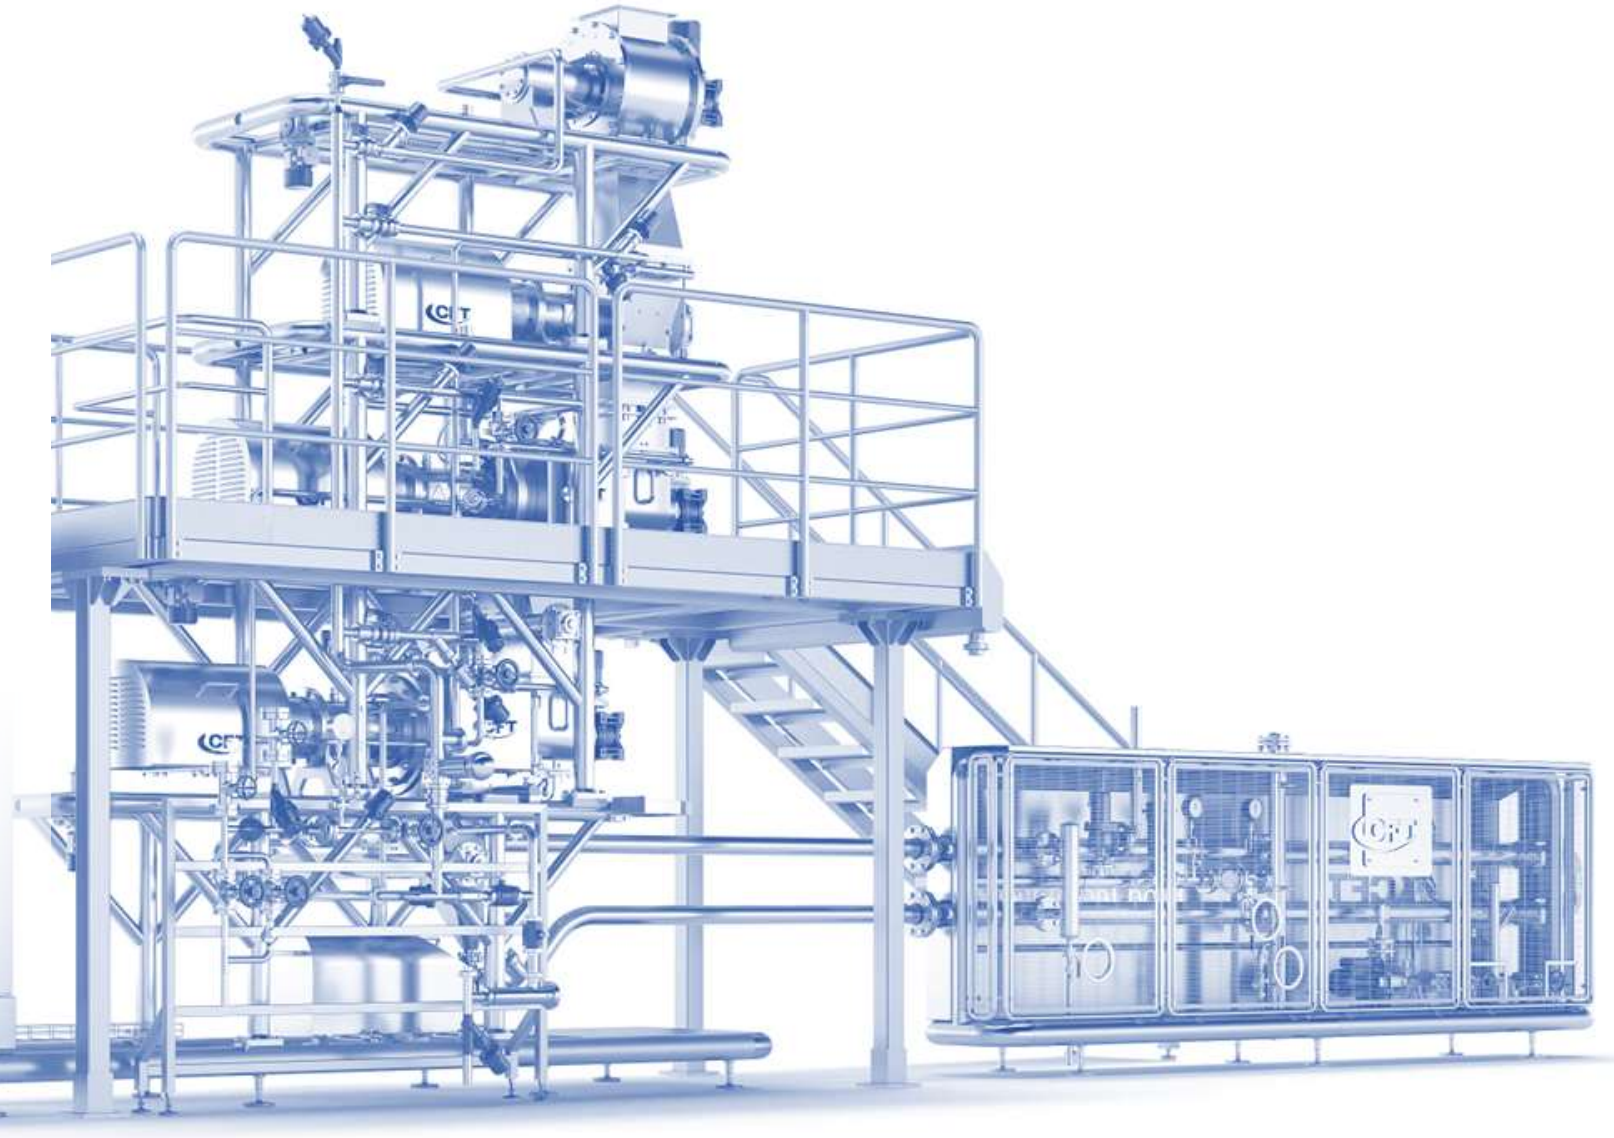

Our five stages of washing (Chlorine, Soft Water, Brush, Warm Water & RO Water Wash) ensures no germs go through..

Industry's Best

Equipped with Destoner, Cold Extractor, Enzymatic Deactivator, Turbo Refiner, and Homogenizer, the Manzini Giubileo pulping solution is fully automated and synchronized to deliver the best quality pulp without any human intervention.

Going the Extra Mile

Just to be sure, even after having the most advanced pulping solution, we have added the AlfaLaval Foodec Decanter Centrifuge to our production line. It rotates at blistering 3800rpm to separate any other remaining black particles or fiber.

Zero Preservatives

We sterilize the pulp through CFT patented heat exchanging technology that ensures 100% sterilization without requiring any preservatives or additives. It makes sure no microbiological activities are present in the pulp and prepares the pulp for long storage in the most natural form.

Aseptic All the Way

Aseptic bag opening, pulp filling, and closing operations are performed in an automated sterile environment. Filled aseptic bags are stored inside food-grade painted steel drums with an inner LDPE bag liner that ensures a long product life at room temperature.
